ARTIN'S L-FUNCTIONS AFTER WEIL, GROTHENDIECK

BERNDT E. SCHWERDTFEGER

To Jo on his $3F^{th}$ birthday.

PREFACE

This paper summarizes some notes taken when comparing WEIL's presentation of ARTIN's L-functions in [4] with GROTHENDIECK's in [1].

Berlin, 15 November 2011

1. ARTIN L-FUNCTIONS ACCORDING TO WEIL

1.1. **DIRICHLET-series.** In general we will use the notation of WEIL in [5, VII] and [4, II]. We recap some basic notation.

Let k denote a global field, i.e. either an algebraic number-field (a finite field extension $k/\mathbf{Q}$) or an algebraic function-field of dimension 1 over a finite field of constants. For each place v of k its completion is denoted k_v. For finite places the local ring of integers is $\mathfrak{o}_v$ and its maximal ideal $\mathfrak{p}_v$.

The free abelian group of all $\mathfrak{p}_v$ is called group of *divisors* and is denoted $\mathfrak{M}$; it is written *multiplicatively*. A divisor $\mathfrak{m} \in \mathfrak{M}$ is *positive* if the exponents of all $\mathfrak{p}_v$ are positive. The positive divisors form the semigroup $\mathfrak{M}_+$. In characteristic 0 (number-fields) $\mathfrak{M}$ corresponds to the group of fractional ideals of k and $\mathfrak{M}_+$ to the ideals $\neq 0$ in the ring of integers $\mathfrak{o}_k$ of k. In characteristic > 1 (function-fields) $\mathfrak{M}$ corresponds to the *line bundles* on the associated complete curve – this aspect will not be delved into in this article. As we want to compare WEIL's treatment of ARTIN's L-functions with GROTHENDIECK's we are particularly interested in the *function-field* case.

Let $\Omega_k = \mathrm{Hom}(\mathbf{A}_k^\times/k^\times, \mathbf{C}^\times)$ be the group of (not necessarily unitary) characters on the idele class group of k. WEIL attaches to a function $c : \mathfrak{M}_+ \longrightarrow \mathbf{C}$ an *extended* DIRICHLET-series belonging to k by

$$L(c,\omega) = \sum_{\mathfrak{m}\in\mathfrak{M}_+} c(\mathfrak{m})\omega(\mathfrak{m})$$

This series is absolutely convergent for $\mathrm{Re}\,\omega > \alpha + 1$ if and only if $|c(\mathfrak{m})| \le C|\mathfrak{m}|^{-\alpha}$ for some $C > 0$ and some $\alpha \in \mathbf{R}$.

The coefficients $c(\mathfrak{m})$ are uniquely determined by the function $L(c,\omega)$.

2010 *Mathematics Subject Classification.* Primary 11M41; Secondary 11R42.
Key words and phrases. Artin-, Hecke L-functions, Dirichlet-series, Weil groups, Galois representations, inertia, decomposition group.

1.2. **ARTIN-HECKE L-series.** Let W_k be the WEIL group of k. The quotient by its derived group W_k/W_k' is canonically isomorphic to the idele-class group $\mathbf{A}_k^\times/k^\times$ by class field theory, let $\alpha_k : \mathbf{A}_k^\times/k^\times \xrightarrow{\sim} W_k/W_k'$ denote the ARTIN reciprocity map. So, we can also identify the characters $\omega \in \Omega_k$ on the idele-class group with the abelian characters $\chi : W_k/W_k' \longrightarrow \mathbf{C}^\times$ (representations of degree 1).

Let X_k be the ring of representations of W_k (the WEIL group). If k'/k is a separable extension of degree d, then $W_{k'}$ is of index d in W_k and we can induce representations from $W_{k'}$ to W_k, denoted $\chi' \mapsto [\chi'; k'/k]$, and considered as a mapping $X_{k'} \longrightarrow X_k$.

To each finite separable extension k'/k and to every character $\chi' \in X_{k'}$ there is attached a divisor $f_{k'}(\chi')$ of k' and an extended DIRICHLET series $L_{k'}(\chi')$ satisfying the following properties ([4, §73])

(1) For $\deg\chi' = 1$ the divisor $f_{k'}(\chi') = f(\omega')$ is the conductor of $\omega' = \chi' \circ \alpha_{k'}$ and the L-series is the usual HECKE series to the Größencharakter ω' as in WEIL [5, VII] $L_{k'}(\chi') = L(\omega')$.
(2) The mappings $\chi' \mapsto f_{k'}(\chi')$ and $\chi' \mapsto L_{k'}(\chi')$ are *homomorphisms* of the additive group $X_{k'}$ into the multiplicative groups of the divisors $\mathfrak{M}_{k'}$ of k', and of the DIRICHLET series belonging to k' with initial coefficient 1, respectively.
(3) For $k''/k'/k$ let $D(k''/k')$ be the *discriminant* of k'' over k', let χ'' be any character of $W_{k''}$ of degree $n = \deg\chi''$. Then

$$f_{k'}([\chi''; k''/k']) = \mathrm{N}_{k''/k'}(f_{k''}(\chi''))D(k''/k')^n$$
$$L_{k'}([\chi''; k''/k']) = [L_{k''}(\chi''); k''/k']$$

From these properties it is clear that these conditions determine the L-series for all characters.

For function fields WEIL has proven the ARTIN conjecture that these L-functions are *holomorph* for positive characters $\chi \neq 1$ ([2, II^e partie, §V, n^o 27-28]).

2. ARTIN L-FUNCTIONS ACCORDING TO GROTHENDIECK

2.1. **Definition of Z- and L-functions.** In [1], following WEIL [3, p. 507], GROTHENDIECK discussed the Z- and L-functions for a scheme Y of finite type over a finite field $\mathbf{F}_q$. Let the finite group G operate on the right such that $X = Y/G$ exists, let $\rho : G \longrightarrow GL(V)$ be a representation in a finite dimensional vector space over a field F of characteristic 0 (classically $F = \mathbf{C}$, but we might also take $F = \mathbf{Q}_\ell$ or $F = \mathbf{C}_\ell$).

The ARTIN L-function is defined by

$$L(Y, G, X, t) = L(Y/X, \rho, t) = \prod_{x \in X^0} \frac{1}{\det(1 - \rho^\natural(x)\, t^{d(x)})}$$

where X^0 = set of *closed* points of X, $d(x) = \deg x = [\kappa(x) : \mathbf{F}_q]$ is the residual degree and

$$\rho^\natural(x) = \frac{1}{|T_y|} \sum_{\substack{s \in G_y \\ s \to \varphi_y}} \rho(s) \in \mathrm{End}(V)$$

where $y \to x$ for a point y in the fiber Y_x, with G_y the *decomposition* group, T_y is the *inertia* group ($e(y/x) = |T_y| = e(x)$ is independent of y/x) and $\varphi_y \in G_y/T_y \simeq G(\kappa(y)/\kappa(x))$ is the FROBENIUS in the GALOIS group of the residual extension.

We have

$$\log L(Y/X,\rho,t) = \sum_{\nu\geq 1} c_\nu(Y,G,\rho)\,t^\nu/\nu$$

$$c_\nu(Y,G,\rho) = \sum_{x\in X(\mathbf{F}_{q^\nu})} Tr_\rho^\natural(\varphi_x)$$

where

$$Tr_\rho^\natural(\varphi_x) = \frac{1}{|T_y|}\sum_{\substack{s\in G_y\\ s\to\varphi_x}} Tr_\rho(s)$$

where $y\in Y(\mathbf{F}_{q^\nu})$ is above the point $x\in X(\mathbf{F}_{q^\nu})$ and φ_x is the FROBENIUS.
